ABSTRACT

Poor sexual performance is a major factor that affects the quality of life. Sexual health requires a positive approach to human sexuality. Cardiovascular leakages and diabetes are the major factors that are responsible for poor sexual performance and reproductive health. This review is aimed at reviewing the pharmacological and phytochemical properties of various medicinal plants used for the improvement of sexual performance and virility. Psychotherapeutic, pharmacological and traditional methods have been used in the management of poor sexual performance and virility. Drugs such as papaverin, alprostaldin and stimulants like apomorphine have been used to improve sexual health. The use of plant such as Panax ginseng C. A. Meyer (Araliaceae), Cannabis sativa L. (Cannabinaceae), Myristica fragrans Houtt. (Myristaceae), Mucuna pruriens Linn. (Leguminosae), Chlorophytum borivilianum Santapau & R.R.Fern. (Liliaceae), Eurycoma longifolia Jack (Simaroubaceae) and Zingiber officinale Roscoe (Zingiberaceae) have been established in the management of sexual dysfunction. The aphrodisiac activities of plants may be as result of their bioactive constituents. This research has therefore shown that the reviewed plants can be used for the management of poor sexual performance and virility.

Keywords: Sexuality; Aphrodisiacs; Health; Phytochemicals; Virility

INTRODUCTION

Sound sexual and reproductive health is one of the major factors that contribute to happy family and good self-esteem among several men and women. Infertility has also played a major role in the disintegration of many families. Sexual health requires a positive approach to human sexuality and an understanding of the complex factors that shape human sexual behaviour [1]. Whether the expression of sexuality leads to sexual health and well-being or to sexual behaviour that put people at risk; it is determined by these factors which could also result to sexual and reproductive ill health [2]. Sexual performance anxiety is a cisgender and very real, upsetting, legitimate issue. It is no secret that our patriarchal culture at large does not understand women sexuality. Because of all the unnecessary and damaging “mystery” surrounding female sexual desire, performance anxiety for women is not often discussed because we don’t really know how to discuss it. For men, sexual performance is an ability to maintain an erection throughout the period of sexual intercourse and this ability of men’s penis to stay erected hard for the duration of sex is a guarantee for a climax. For women, when sexual act creates fear, stress and worry, the
body releases stress hormones- epinephrine and norepinephrine and this worry or stress is usually created by poor sexual confidence and fear of not being able to please your partner- the fear of physical intimacy. The production of these hormones in the body causes poorly wet or dry vagina, highly tense vagina muscles which lead to difficult penetration or nearly impossible penetration and poor desire for sex [3].

The ability to procreate is enhanced through sound sexual health. Poor sexual performance is a major factor that must be overcome for lasting peace in some marriages. Sexuality is a central aspect of being human throughout life and encompasses sex, gender and roles, sexual orientation, eroticism, pleasure, intimacy and reproduction. Sexuality is experienced and expressed in thoughts, fantasies, desires, beliefs, attitudes, values, behaviour, practices, roles and relationships. It is also important to note that while sexuality can include all of these dimensions, not all of them can be experienced or expressed. Sexuality is influenced by the interaction of biological, social, economic, political, cultural, ethical, historical, and religious and spiritual factors [4-5]. Sexual health requires a positive and respectful approach to sexuality and sexual relationships as well as the possibility of having pleasurable and safe sexual experiences free of coercion, discrimination and violence.

The concept of sexual performance varies from one individual to another. Sexual performance is naturally important to men due to their ego and instincts to procreate. The ability to satisfy a woman, the size of a man’s penis which is often though wrongly associated with sexual ability is what makes up every man. Poor sexual performance causes low self-esteem and due to natural sexual instinct, humans are able to attract suitable mates and procreate. Sexual performance in male sex is fundamental in the following areas; the ability to satisfy a woman and give her orgasms and the ability to impregnate a woman [6].

Poor sexual performance can be defined in various ways based on one’s concept of sexual health. The inability to give a woman an orgasm, inability to erect and sustain and erected penis, premature ejaculation, being selfish towards your lover’s needs during sexual intercourse, ignoring foreplay, being too uptight during sex which can make the experience less sensual, routine and boring sex as well as poor communication constitutes poor sexual performance [7].

Poor sexual performance may also be due to erectile dysfunction which occurs as a result of both physiological and mental factors. Low sexual desire is expected to be associated with low sexual activity. Like sexual desires, sexual activity also declines with age. W.H.O estimated over 48.5 million infertile couples worldwide. Poor sexual performance can be manifested in the first three phases of sex viz; stimulation, the plateau and the climaxing phase. These manifestations are usually in the form of low libido, painful sex, premature ejaculation, poor lubrication in women which can hinder pleasurable sex and the inability to achieve orgasm.

According to [8], poor sexual performance can be attributed to numerous factors including hormonal imbalance, congenital disorders such as micropenis and Peyronie’s disease, smoking, excessive alcohols, small penis size or an excessive penis size, fatigue, stress, performance anxiety, past sexual trauma, age factor and poor body image. Sound sexual health can be achieved through counseling and sex therapy, medication, and lifestyle changes. Medical checkups are regularly recommended to ensure it is not due to any untreated medical condition, quitting smoking, sexual compatibility and regular kerglass exercise.

In Ayurveda, poor sexual performance includes a cessation of the sexual desire owing to increased thoughts and forced intercourse, excessive use of certain substances with pungent, acid or saline taste or heat making articles which leads to loss of Saumya Dhatu (watery principle) of the organism, virile impotency resulting from inadequate semen in persons addicted to excessive sexual pleasure, diseases such as syphilis, Sahaja impotency (congenital or sexual incapacity from birth), voluntary suppression of the sexual desire by a strong man observing perfect continence and impotency due to the destruction of local Marma (spermatic cord) [9].

Male impotence or erectile dysfunction is caused mainly by cardiovascular leakages and diabetes among other factors and the use of plants or plant based products to stimulate sexual desire and to enhance performance and enjoyment is almost as old as human race itself. Androgens play significant role in male reproductive health as it acts centrally and peripherally during initiation and sexual intercourse. Stimuli such as steroids (testosterone) are known to either upregulate or downregulate androgen response [10]. Treatment of erectile dysfunction may involve psychotherapeutic approach and pharmacotherapy using drugs such as papaverin, alprostadil, vardenafil and central stimulants like apomorphine or herbal drugs with aphrodisiac activity [11].

Natural products are available in texts of Ayurveda for their spermatogenic and virility potential activities. Ayurvedic aphrodisiac therapeutics is grouped into vajikarana (pharmacological) and rasayana (non-pharmacological products)
Aphrodisiac Plants
The term ‘aphrodisiac’ was derived from the Greek word ‘aphrodite’ which represents a symbol of love and beauty. Over the years, a large number of natural remedies have played different roles as aphrodisiacs in different cultures and civilizations. There is a natural interest of human beings for substances that stimulate libido, potency, virility, and sexual pleasure as it takes care of sexual desires, ejaculation, orgasm and erectile dysfunction. An aphrodisiac literally includes substances that have played significant roles in the management of sexual dysfunction and which also improves sexual behaviour and satisfaction in humans and other animals [12]. According to Ayurveda, aphrodisiacs are classified in the following categories; drugs which increase the quantity of semen or stimulate the production of semen such as Microstylis wallichii, Roscoea proceria, Polygonatum verticillatum, Mucuna pruriens and Asparagus racemosus, drugs which purify and improve the quality of semen for example, Saussurea lappa, Myrica nagi, Sesamum indicum, Vetiveria zizanoides and Anthocephalus cadamba, drugs which improve ejaculatory functions for example, Strychnos nux vomica, Cannabis sativa, Myristica fragrans and Cassia occidentalis, drugs delaying the time of ejaculation or improving ejaculatory performance such as Sida cordifolia, Asparagus racemosus, Cinnamonomum tamala, Anacyclus pyrethrum, Mucuna pruriens and Cannabis sativum, drugs arousing sexual desire, namely. Withania somnifera, Asparagus racemosus, Datura stramonium, Anacyclus pyrethrum, Hibiscus abelmoschus and opium [13](Table 1).

The use of plant based products to stimulate sexual desires and enhance performance and pleasure is almost as old as human race itself since man cannot alienate self from using plants and plant based products for the treatment of his ailments. Aphrodisiacs are basically grouped into two; psychophysiological stimuli (visual, tactile, olfactory and aural) preparations and internal preparations such as food, alcoholic drinks and love potion. Aphrodisiacs can also be categorized based on their mode of action into three groups; substances that increase libido (sexual desire and arousal), substances that increase sexual potency (effectiveness of erection) and substances that increase sexual pleasure [14].

From a scientific standpoint, many historically “powerful” aphrodisiacs may have had such strong results due to mere belief or their powers by users, while nowadays, because of science, many foods are considered to be helpful in your sex life because of the nutrients, vitamins and minerals which they contain. Many herbs have been scientifically proven to increase sexual desire and much more. Plants which possess ability to boost sexual performance and virility include the following; Almonds, Asparagus, Avocado, Banana, Coconut, Dates, Garlic, Mango, Mushroom, Olive, Onion, Sesame seeds, Parsely, Wheat grass, Mints, Aloe, and Celery among others [15]. Apart from medicinal plants, several other drugs of metal and mineral origin are also described in ayurveda for their spermatogenic and virility activities. These include varatika (calcium), gold, etc, Animal products such as meat soup of cock, peacock, swan or sparrow; semen of crocodile, etc. have been reported to possess aphrodisiac activity [16] (Figure 1-10).

Mechanism of action of aphrodisiac plants
Penile erection is controlled by the balance between the factors leading to the contraction and relaxation of smooth muscles of the corpus cavernosa, these effects may occur directly on the central nervous system and/or on the peripheral nervous system by the alteration of blood flow to the genitalia. Neurochemical systems such as norepinephrine, dopamine, serotonin, acetylcholine and histamine work together for increase in sexual arousal.

There are different mechanisms of action of aphrodisiacs such as nitric oxide (NO)-based mechanism of action and androgen based mechanism of action. The neurotransmitter NO drives the relaxation of the penile vasculature and trabecular smooth muscles which play significant roles in penile erection. Relaxation of the trabecular smooth muscles of the corpus cavernous leads to decreased vascular resistance and increased blood flow to the penis. A decrease on outflow is ensured by the compression of the subtunical venules. Both increased inflow and decreased outflow results to penile engorgement and erection. Vasodilation is mediated by NO from the vascular endothelium of the sinusoids and nonadrenergic, noncholinergic and cavernosal nerves (Figure 10-20).

Androgens such as testosterone play crucial role in the development of secondary sexual characters such as epididymis, vas deferens, seminal vesicle, prostate and the penis. The conversion of testosterone to estradiol in the hypothalamus increases sexual functions. Penile erections are also caused by cyclic adenosine monophosphate pathway (cAMP) through the mediation of corporal smooth muscles and respective enzymes and proteins such as prostaglandin and the protein kinase G which causes smooth muscles relaxation and also increases the concentration of Ca2+ which induces a loss of the contractile tone of the penile smooth muscles and increase blood flow in the cavernous body thus yielding and erection [17-19] (Figure 20-29).

CONCLUSION

Poor sexual performance is a significant factor in human life since it affects man in numerous ways. It is significant that issues surrounding poor sexual performance and virility are unraveled in various economies of the world. Several plants have proven useful in the management of sexual disorders throughout history, even herbs and spices have been used to enhanced sexual activities in various parts of the world. There is great need for substances that are used to treat sexual dysfunction in humans. The use of aphrodisiacs is prominent in many countries of the world including Nigeria.

Aphrodisiacs can be used directly or indirectly in the management of sexual dysfunction and improvement of virility. Demand for natural aphrodisiacs require further studies to properly understand their effects on human and safety profile, uses of aphrodisiacs can be harmful due to unavailable data on safety, mechanism of action and knowledge to support their extensive use in procreation. Isolation and characterization of the active constituents of plants used in improvement of sexual performance and virility can cause a dynamic change in the world today. It is pertinent that the phytochemistry of all plant used to treat sexual dysfunction and which also plays a significant role in the improvement of virility is studied. This review emphasizes pharmacology and phytochemistry of all reviewed plants.
