ABSTRACT

A simple, sensitive, accurate, precise and robust high performance thin layer chromatographic method for simultaneous quantification of Ambroxol hydrochloride, Phenylephrine hydrochloride, Chlorpheniramine maleate, Paracetamol and Guaiphenesin in tablet dosage form has been developed and validated. Chromatographic separation was carried out on Merck precoated aluminium plates with silica gel 60 F₂₅₄ as the stationary phase. It is a double development method in which first optimized mobile phase used was ethyl acetate for Paracetamol and Guaiphenesin. Second mobile phase used was toluene: methanol: glacial acetic acid (1.4:8.3:0.3, v/v/v) for Ambroxol hydrochloride, Phenylephrine hydrochloride, Chlorpheniramine maleate. Detection wavelength was carried out at 277nm in reflectance/absorbance mode. The retardation factors were found to be 0.82±0.02 for Ambroxol hydrochloride, 0.67±0.02 for Phenylephrine hydrochloride, 0.12±0.02 for Chlorpheniramine maleate, 0.63±0.02 for Paracetamol and 0.47±0.02 for Guaiphenesin. Developed method was validated as per ICH Q2 (R1) guideline. Linearity range for AMB was found to be 1000-10000 ng band⁻¹, for PHE 200-2000 ng band⁻¹, for CPM 100-1000 ng band⁻¹, for PARA 100-1000 ng band⁻¹ and that of GUA 500-3000 ng band⁻¹. The tablet dosage form was found to contain 99.41% (w/w) AMB, 99.77% (w/w) PHE, 100.37% (w/w) CPM, 100.98% (w/w) PARA and 100.44% (w/w) GUA.

Key words: Ambroxol hydrochloride, Phenylephrine hydrochloride, Chlorpheniramine maleate, Paracetamol, Guaiphenesin, HPTLC, Validation.

INTRODUCTION

Ambroxol hydrochloride (AMB)⁴, a mucolytic agent is trans-4-[(2-Amino-3,5-dibromophenyl)-methyl] - amino] - cyclohexanol hydrochloride (Figure 1). Literature survey revealed that some chromatographic methods has been reported for AMB either individually or in combination with other drugs²,³,⁴.
Phenylephrine hydrochloride (PHE)\textsuperscript{[5]} is a sympathomimetic drug used to treat nasal decongestion. Chemically, it is (R)-1-(3-hydroxyphenyl)-2-methylaminoethanol hydrochloride (Figure 2). Literature survey revealed that spectrophotometric\textsuperscript{[6]}, chromatographic\textsuperscript{[6]} methods have been reported for PHE individually or in combination with other drugs.

Chlorpheniramine maleate (CPM)\textsuperscript{[7]} is an antiallergic agent used to relieve symptoms of allergy, fever and common cold. CPM is (S)-3-(4-chlorophenyl)-N,N-dimethyl-3-(pyridin-2-yl)propan-1-amine maleate (Figure 3). Literature survey reveals that UV\textsuperscript{[8]}, HPLC\textsuperscript{[9]}, HPTLC\textsuperscript{[10]} methods have been reported for CPM.

Paracetamol (PARA) is an analgesic and antipyretic drug used for the relief of fever, headaches and other minor aches and pains.\textsuperscript{[11]} Paracetamol is N-(4-hydroxyphenyl) acetamide (Figure 4). Literature survey reveals that UV\textsuperscript{[12]}, HPLC\textsuperscript{[13]}, HPTLC\textsuperscript{[14]} methods have been reported for paracetamol.

Antiallergic agent Guaiphenesin (GUA)\textsuperscript{[15]} is (+)-3-(2-methoxyphenoxy)- propane-1,2-diol (Figure 5). Literature survey revealed that UV\textsuperscript{[15]}, HPLC\textsuperscript{[16]}, HPTLC\textsuperscript{[17]} methods have been reported for Guaiphenesin.
Literature survey revealed that individual analytical methods are available for selected drugs but densitometric method for simultaneous quantification is not available and hence study was undertaken.

**EXPERIMENTAL SECTION**

**Chemical and reagents**
Ambroxol hydrochloride was obtained as a gift sample from Emcure Pharmaceuticals Limited, Pune. Phenylephrine hydrochloride and chlorpheniramine maleate was supplied as a gift sample by Centaur Pharmaceutical Private Limited, Pune. Guaiphenesin was kindly supplied as a gift sample by Okasa Pharma Private Limited, Sata ra. Phenylephrine Chemical and reagents were procured form E. Merck Darmstadt, Germany. Pharmaceutical grade of paracetamol was supplied as a gift sample of by Jain Pharmaceutical Limited, Pune. The standard stock solution was prepared 1000 µg mL\(^{-1}\) for AMB, PHE, CPM, PARA and GUA by dissolving 10 mg of standard drug in 10 mL methanol separately in volumetric flask to get 1000 µg mL\(^{-1}\).

**2.2 Instrumentation**
The CAMAG HPTLC system consist of Camag 100 µL syringe, Camag twin trough glass chamber, Camag TLC scanner III, Camag Linomat V sample applicator. The plates were washed with methanol and activated at 110 °C for 5 min before use. The bands applied were 6 mm wide and 5 mm apart and application rate was 0.1 µL s\(^{-1}\).

**HPTLC conditions:**
Chromatographic separation was carried out by double development linear ascending method in 20 ×10 cm twin trough glass chamber (CAMAG) previously saturated with the first mobile phase ethyl acetate for 20 min for PARA and GUA. Mobile phase used for each development was 20 mL with 80 mm solvent front. After chromatographic development plates were dried with the current of air and densitometric scanning was performed in reflectance/absorbance mode at 277 nm using CAMAG TLC scanner III operated by winCATS software version 1.4.4. Slit dimension was 5 × 0.45 mm and scanning speed was 10 mm s\(^{-1}\). For AMB, PHE and CPM the mobile phase used was toluene: methanol: glacial acetic acid (1.4: 8.3: 0.3, v/v/v) for 20 min. Mobile phase used for each development was 20 mL with 80 mm solvent front.

**Preparation of standard solution**
The standard stock solution was prepared 1000 µg mL\(^{-1}\) for AMB, PHE, CPM, PARA and GUA by dissolving 10 mg of standard drug in 10 mL methanol separately in volumetric flask to get 1000 µg mL\(^{-1}\).

**2.3 Validation**
The developed method was validated as per ICH Q2 (R1) guideline\(^{[18]}\) for linearity, range, precision, accuracy, specificity, LOD and LOQ.

**Linearity and range**
Linearity was evaluated by applying minimum five concentration six replicates to HPTLC plate for AMB in the range of 1000-10000 ng band\(^{-1}\), PHE 200-2000 ng band\(^{-1}\), CPM 100-1000 ng band\(^{-1}\), PARA 100-1000 ng band\(^{-1}\) and GUA 500-3000 ng band\(^{-1}\). Calibration curve of peak area versus concentration was plotted.

**Precision**
Precision of the method was analyzed by intra and inter-day variation studies. To study intra-day variation each level of precision was investigated by single concentration with six replicates of AMB, PHE, CPM, PARA and GUA. Precision of AMB was studied at 4000 ng band\(^{-1}\), PHE at 1000 ng band\(^{-1}\), CPM at 600 ng band\(^{-1}\), PARA at
400 ng band⁻¹ and GUA at 1500 ng band⁻¹. To study inter-day precision study, single concentration with six replicates of above mentioned drug concentration were analyzed on three successive days.

**Sensitivity**

The limit of detection (LOD) and limit of quantification (LOQ) were calculated to determine sensitivity as 3.3σ/S and 10σ/S, respectively, where σ is the residual deviation of the response (y-intercept) and S is the slope of the linearity plot.

**Specificity**

In specificity studies, AMB, PHE, CPM, PARA and GUA standard solutions and the marketed sample solutions were applied on a HPTLC plate. The plate was developed in the respective mobile phase and scanned as mentioned above. The peak purity of AMB, PHE, CPM, PARA and GUA was assessed by comparing the UV spectra of drugs at peak start, peak apex and peak end positions of the band i.e., r (start, middle) and r (middle, end).

**Accuracy**

The accuracy of the method was evaluated by standard addition method. Samples of AMB, PHE, CPM, PARA and GUA were spiked with 80, 100 and 120 % of standard AMB, PHE, CPM, PARA and GUA.

**Robustness**

Robustness was studied by carrying out small, deliberate changes in analytical conditions. The analytical conditions varied were mobile phase combination (± 0.1 mL), amount of mobile phase (± 5%), time from band application to chromatographic development and time from chromatography to scanning (+ 10 min). One factor was varied at a time to study the variation. The robustness of the proposed HPTLC method was studied six times at concentration of 2000 ng band⁻¹ for AMB, 400 ng band⁻¹ for PHE, 200 ng band⁻¹ for CPM, 200 ng band⁻¹ for PARA and 1000 ng band⁻¹ for GUA as it lies within the range of linearity. The standard deviation of peak areas and % relative standard deviation (% RSD) were calculated for each variable factor.

**Solution stability**

Solution stability of the standard solution 2000 ng band⁻¹ for AMB, 400 ng band⁻¹ for PHE, 200 ng band⁻¹ for CPM, 200 ng band⁻¹ for PARA and 1000 ng band⁻¹ for GUA was studied at an interval of 6h up to 48h. When stored at room temperature and estimated by comparing peak areas at each time interval against freshly prepared standard solution.

**2.4 Analysis of formulation**

The average weight of tablet is 709.2 mg equivalent (AMB 30 mg, PHE 10 mg, CPM 2 mg, PARA 325 mg and GUA 100 mg) was transferred into a 25 mL volumetric flask containing 25 mL methanol. The solution was sonicated for 20 min. followed by filtration to get concentration of 1200 µg mL⁻¹ of AMB, 400 µg mL⁻¹ of PHE 80 µg mL⁻¹ of CPM and from the resulting solution 0.5 mL diluted in 10 mL volumetric flask with methanol. The solution was sonicated for 10 min and filtered to get concentration of 2000 µg mL⁻¹ of PARA and 650 µg mL⁻¹ of GUA. suitable volume was applied to an HPTLC plate and developed in respective optimized mobile phases. This solution was used for the recovery study and assay with suitable dilutions and volume applications.

**RESULTS AND DISCUSSION**

**3.1 Selection of detection wavelength:**

After chromatographic development bands were scanned in the range of 200 to 400 nm and spectra were overlain. AMB, PHE, CPM, PARA and GUA showed considerable absorbance at 277 nm and hence was selected for densitometric analysis. (Figure 6).

**3.2 Optimization of chromatographic conditions**

The mobile phase was optimized to get desired Rᵥ value range [0.1 - 0.9] with a resolution of > 1.5. It was achieved by trying different mobile phases containing different polarity solvents in different ratios like toluene, n-hexane, dichloromethane, ethanol, methanol, water and ethyl acetate. It was observed that five drugs does not move in a single mobile phase hence double development strategy was applied. In which the first mobile phase was ethyl acetate for PARA and GUA. Both drugs showed desired Rᵥ values and resolution. Second solvent system containing toluene: methanol: glacial acetic acid (1.4: 8.3: 0.3, v/v/v) was selected as it gave reproducible results for AMB,
PHE and CPM. The development chamber was saturated with respective mobile phases for 20 min and development distance was 80 mm. The retardation factor for AMB, PHE, CPM, PARA and GUA was found to be 0.82±0.02, 0.67±0.02, 0.12±0.02, 0.63±0.02 and 0.47±0.02, respectively (Figure 7).
3.3 Validation of the method

Linearity and range

Result showed that standard drug concentration and peak areas were found to be linear in the range of 1000-10000 ng band\(^{-1}\) for AMB, 200-2000 ng band\(^{-1}\) for PHE, 100-1000 ng band\(^{-1}\) for CPM, 100-1000 ng band\(^{-1}\) for PARA and 500-3000 ng band\(^{-1}\) for GUA. A good linear relationship was observed for all five drugs (Figure 8).

Sensitivity
Result (Table 1) showed that the method is sensitive for the analysis of selected drugs.

Specificity
The peak purity for AMB, PHE, CPM, PARA and GUA was assessed by comparing UV spectrum acquired at the start (S), apex (M), and end (E) of the peak obtained from the scanning of band, that is, \( r(S, M) = 0.998, 0.998 \) and \( r(M, E) = 0.998, 0.998 \), respectively. Peak purity data showed that peaks obtained for AMB, PHE, CPM, PARA and GUA were pure and method is specific.

Precision
Both intra and inter-day precision studies showed \( \% \text{ RSD} < 2 \), as recommended by ICH guidelines, indicating good precision (Table 2).

(AMB – 9000 ng band⁻¹, PHE – 1500 ng band⁻¹, CPM – 10000 ng band⁻¹, PARA – 100 ng band⁻¹, GUA – 500 ng band⁻¹); n- no of replicates, RSD-relative standard deviation.

Solution stability
Stability of standard solution of AMB, PHE, CPM, PARA and GUA were assessed at room temperature for 48h. The % RSD < 2 indicates that the solution were stable for 48h. at room temperature.

3.4 Analysis of marketed formulation
Developed densitometric method was applied to the selected marketed formulation. (Febrex CCF®) found to contain 99.41% of AMB, 99.77% of PHE, 100.37% of CPM, 100.98% of PARA and 100.44% of GUA.

CONCLUSION
The developed and validated HPTLC method is new, simple, accurate, fast, precise and robust and thus can be used for simultaneous quantification of Ambroxol hydrochloride, Phenylephrine hydrochloride, Chlorpheniramine maleate, Paracetamol and Guaiphenesin in selected pharmaceutical formulation.
