ABSTRACT

Impact of calcium and magnesium in diet to determine offspring gender in high-sugar rabbit has been investigated. Diabetes mellitus is a chronic, widely spread disease in living species. Sex determination has scientific basis for prevention of genetic diseases in addition to social backgrounds. 21 rabbits (obtained from veterinary college Bangalore), were divided into three groups in the rabbits male to female 1:1. The first group was made diabetic with Ca and Mg, the second group was non diabetic with Ca and Mg, group third was control unit (Non-diabetic without Ca and Mg). It was found that the delivered offspring female to male ratio were 3.4:1, 3.3:1 and 1.06:1 for the first, second and third groups respectively. Also, it was found that non diabetic rabbits fed with normal food yields maximum numbers of offspring (72), while non diabetic rabbits fed with Ca and Mg yields 56 and diabetic hamsters with Ca and Mg yield lowest numbers of offspring (49).

Keywords: Calcium, Diabetes, Magnesium, Sex ratio, Rabbit, Offspring.

INTRODUCTION

Pregnancy is a state that allows a life form to develop with the support and protection from mother's body. The growth and development of the fetus in gestation is partially determined by the genome of the fetus, which produces its own growth factors as well as the majority of its hormones. However, this genetic influence is highly dependent upon interaction with environmental factors. One environmental factor vital in the growth and development of the fetus is nutrition. The fetus is solely dependent on the mother to supply its nutrients. It is also dependent on the placenta, an essential organ in pregnancy, to transfer these nutrients from the maternal system to its own. Thus the fetal nutrition is a reflection of that of the mother's. This interaction exists in a sensitive equilibrium; if disturbed, there are fetal developmental consequences. Preselection of the gender of offspring is a subject that has held man's attention since the beginning of recorded history. Although scientific studies on genes have been conducted recently, sex selection and gender preference have been considered since ancient time. Anaxagoras, a Greek scientist was the first person who related the sex of fetus to testis. Gestational diabetes mellitus (GDM) is a frequent complication of pregnancy, affecting 3.5% of pregnancies in the United States. Because obesity and age are major risk factors for GDM, the prevalence of GDM is increasing. Although GDM may represent a previously unrecognized state of continuous hyperglycemia (ie, diabetes), most women with GDM show glucose intolerance that does not persist after pregnancy. Women with GDM have been shown to be more insulin-resistant than normal pregnant women, and their insulin secretion is defective relative to the degree of insulin resistance.
There is a strong association between pregnancy in women with any form of diabetes and high infant mortality and morbidity in their offspring [7]. Over the past 25 years, the rate of neonatal mortality among infants of diabetic mothers has declined from 250 per 1000 live births to approximately 20 per 1000 live births.

About half of these deaths are due to congenital malformations that result from the diabetic intra-uterine environment[8]. The frequency of congenital malformation, as well as morbidity associated with maternal diabetes, is directly related to the severity of the diabetes [9]. Abnormalities in systems such as the cardiovascular system, musculoskeletal, and central nervous system occur 5 times more often in the offspring of diabetic mothers. Rare abnormalities like sacral agenesis and caudal regression syndrome occur between 200 and 400 times more frequently than the non-diabetic population [8]. There are many Methods of sex selection such as: The consumption of particular foods, the use of various vaginal douches and the timing of intercourse in relation to ovulation, Sperm sorting, Pre-implantation genetic diagnosis (PGD), Selective abortion, Infanticide, Periconceptual methods, postconceptual methods.

There are also methods which use different food combinations and especial diets to maximum the chance of having a baby with specific sex. The old believe is that eating salty, savory foods leads to delivering a male and calcium rich foods to a girl. Some believes that the ratio of the minerals sodium, potassium, calcium and magnesium are important in determination of offspring gender. It was shown that pregnant female house mice maintained on a consistent low-food diet give birth to a lower proportion of males than do control females fed ad libitum [10].

As a part of our ongoing research, we studied the Role of Sodium and Potassium ions in identification of offspring gender in high-sugar mammals [11-13].

In this study, we induce experimental diabetes with Streptozocin to study the effects of adding bi-valent ions (calcium and magnesium) to the drinking water of rabbits and offspring sexes were investigated.

**EXPERIMENTAL SECTION**

Streptozocin or Streptozocin or Izostazin or Zanosar (STZ) is a synthetic antineoplastic agent that is classically an anti-tumor antibiotic and chemically is related to other nitrosoureas used in cancer chemotherapy. Streptozocin sterile powders are provided and prepared as a chemotherapy agent. Each vial of sterilized Streptozocin powder contains 1 g. of Streptozocin active ingredient with the chemical name, 2-Deoxy-2-[(methylnitrosoamino)-carbonyl]amino]-D-glucopyranose and 200 mg citric acid. Streptozocin was supplied by Pharmacia Company. Streptozocin is available for intravenous use as a dry-frozen, pale yellow, sterilized product. Pure Streptozocin has alkaline pH. When it is dissolved inside the vial in distilled water as instructed, the pH in the solution inside the vial will be 3.5-4.5 because of the presence of citric acid. This material is prepared in 1-g vials and kept in cold store and refrigerator temperature (2-8 °C) away from light. Control animals were given an equivalent volume of citrate buffer solution.

21 Adult female rabbits weighting 1100-1300 g (9 months old) To Induction of diabetes, rabbits were fasted for 12 h before inducing diabetes, 7adult rabbits were used for inducing diabetes. The rabbits were injected by a single intra-peritoneal streptozocin at the dose of 40 mg/kg of the body weight. STZ was freshly dissolved in 0.05 M citrate buffer, pH 4.5. For the i.p. injection of STZ, the rabbits were held in one hand in dorsal position, the injection site was swabbed using povidone- iodine solution and the designated amount of STZ was injected within 10’ after preparation in the caudal abdominal cavity using sterile 25g insulin needle. Streptozocine induces diabetes within 3 days by destroying the beta cells [14]. Blood was collected for glucose determination using a glucometer (Accoutered Glucose, Roche Diagnostics, and Mannheim, Germany). Blood glucose levels were measured on the third day, STZ injected hamsters with blood glucose levels 15 m mol/l (270mg/dl) as well as polydipsia, polyuria and polyphagia for at least one week was considered to be diabetes (STZ rats). 7 control hamsters [non diabetic (Ca, Mg)] and 7 neither diabetic nor (Ca, Mg) were injected with an equal volume of citrate buffer solution.

Diabetic rabbits and non-diabetic control group were kept in metabolic cages individually and separately and within 16-21 days, on the specified diets (Ca, Mg and non Ca, Mg) feeding and metabolism control. The first group diabetics (Ca, Mg) and second group non diabetics (Ca, Mg) was supplied with drinking water mixed with 1% calcium and magnesium, the third group was chosen as a control group neither diabetics nor Ca, Mg, pure drinking water was supplied. After 16-21 days, on the specified diets, the rabbits at the stage of the reproductive cycle were
caged with male rabbit for mating and gestational 10 minutes. When female rabbit is pregnant, she may start rejecting the advances made by the male rabbit. The number of litters and the gender of pups were recorded. Pups were determined their sex by means of the ano-genital distance, which is longer in males [14]; this was confirmed in later examinations during pre weaning development. The data were entered and analyzed by SPSS software using t.test and the p-value. Less than 0.05 were considered as significant.

RESULTS AND DISCUSSION

It was found that, in the first group diabetic mothers (Ca, Mg), all of the 7 rabbits became pregnant which delivered 49 offspring. Their gender was 11 male (22.4%) and 38 female (77.6%). In the second group, non diabetic (Ca, Mg), all of the 7 rabbits became pregnant and delivered 56 offspring, their gender was 13 male (23.2%) and 43 female (76.8%) and in the third group, neither diabetic nor (Ca, Mg) all 7 rabbits became pregnant and delivered 72 offspring that 35 male (48.6%) and 37 female (51.4%) (Table 2).

The sex ratio of female to male in the first group of diabetic mothers (Ca, Mg) and in the second group, non diabetic (Ca, Mg) were 3.4:1-3.3:1, While this ratio in the third group, neither diabetic nor (Ca, Mg) was 1.06:1 respectively (Figure 1-2). The percentage of the female offspring of diabetic mothers (Ca, Mg) (77.6%) was higher than the female offspring in control group (51.4%) and also female offspring of non diabetic mothers (Ca, Mg) (76.8%) was higher than the female offspring in control group (51.4%) (Figure 3).

The difference in the sex ratio between the first group diabetic mothers (Ca, Mg) and the second group non diabetic mothers (Ca, Mg) was not statistically significant, while the difference between the group of diabetic mothers (Ca, Mg) with control group and between group non diabetic mothers (Ca, Mg) with control group were statistically significant (Table 1).

Table 2. Sex ratio in different groups of rabbits
The total number of offspring in the first group diabetic mothers (Ca, Mg) (49) was lower than total number of offspring of the second group, non diabetic (Ca, Mg) and also in the third group (56), neither diabetic nor Ca, Mg (72) (Figure4).

Figure 1: Male and female in different groups of rabbits

Figure 2: Male and female in different groups of rabbits
Streptozotocin has been widely used to induce type 1 diabetes in animal models especially rats and mice [13]. It has been reported that STZ induce dose-dependent diabetes administered either intravenously or intraperitoneally [16].
Intraperitoneal injection of STZ led to physiologic alterations consistent with reports of spontaneous and chemically induced diabetes in other animals [17-19]. Preselection of the gender of offspring is a subject that has held man’s attention since the beginning of recorded history. While the natural sex ratio at birth is usually 104–107 male to 100 female [20].

The first medical technique that can be used to select for sex is that of pre-natal diagnosis [PND] and abortion. To utilize this method, the pregnant woman must undergo some sort of prenatal testing, such as an amniocentesis, chorionic villus sampling or an ultrasound, which will allow the doctor to determine the sex of the child, among other things. Once the woman has the information about the child’s sex, she can obtain an abortion if the fetus is not of the desired sex. The use of PND and abortion in order to select the sex sounds extreme, and indeed, as Edgar Dahl points out, it is not common for Westerners to utilize such technique. For example, a follow-up study of 578 patients having prenatal diagnosis at one Melbourne centre found that none of the women had a termination because of the sex of the fetus. Going through the traumatizing experience of an abortion is usually seen as too high a price to pay for a child of a particular sex [21].

The second medical technique that can be used to select for sex is that of pre-implantation genetic diagnosis [PGD] with in vitro fertilization [IVF]. With this technique, the embryos are screened for sex prior to being implanted into the woman’s uterus, thereby eliminating the need to later decide to terminate a pregnancy. PGD and IVF, however, are very invasive and potentially physically harmful, requiring the woman to go through at least one IVF cycle, which includes taking potent drugs to induce super-ovulation, extraction, fertilization and then testing and subsequent implantation of the embryos. Given the expense of IVF treatment cycles (according to IVF Canada in 2005 it cost $5,500 for one cycle of IVF, not including drugs [22] and according to the same source, the drugs themselves can cost approximately $3,000 for one cycle) [23], it would be highly unlikely that it would be used as a technique for sex selection alone. More likely, it could be used as a sex selection technique for those who are already undergoing IVF for other medical reasons.

The last medical technique that can be used to select for sex is sperm sorting. New technologies allow sperm to be sorted into those carrying X or Y chromosomes with varying degrees of accuracy. To date, the most successful way in which to sort sperm is flow cytometry, which has been branded as the Micro Sort technique [22]. Sex selection using flow cytometry results from distinguishing between the identifiable differences between the X and Y chromosomes, as the X chromosome is larger than the Y. The sorted sperm is then used to artificially inseminate the woman. Studies have shown that the Micro Sort technique is more effective in selecting for girls, a success rate of 91%, than for boys, with a success rate of only 76%. Sperm sorting appears, then, to be the least invasive and least expensive (at about $2,300US per cycle) method of selection of sex.

There are also methods which use different food combinations and especial diets to maximum the chance of having a baby with specific sex. The old believe is that eating salty, savory foods leads to delivering a boy and calcium rich foods to a girl. Some believes that the ratio of the minerals sodium, potassium, calcium and magnesium are important in determination of baby gender. It was shown that pregnant female house mice maintained on a consistent low-food diet give birth to a lower proportion of males than do control females fed ad libitum [24].

CONCLUSION

Today one of good known methods on sex constitution is the preconception diet method. This method claims 80% accuracy and the theory is that by altering your diet to include and exclude certain food, the condition in the reproductive tract will be directly affected; increasing the odds of conceiving a particular sex it is also recommended that both mother and father go on the diet. This is also consistent with the oriental philosophy that everything has a yin or yang quality and the foods supplied in the female diet, female and acid are all yin. The female diet is high in calcium but low in salt and potassium, containing acid forming foods. The diets nutritional content is questionable and contains multiple warnings. The diet may influence the conditions within the reproductive tract and the outer barrier surrounding the ovum. Enabling only one of the two types of sperm to penetrate the depending on which diet is adhered to. Langendon and Proctor first published 'the preconception Gender Diet' based on results reported 25. The theory is that by altering your diet to include and exclude certain foods, the conditions in the reproductive tract will be directly affected, increasing the odds of conceiving a particular sex. This method under scrutiny claims of 80%accuracy based on one clinical trial of only 260 women, the results were published in the international journal.
of Gynecology and Obstetrics in 1980. The female diet is high in calcium but low in salt and potassium, containing acid forming foods. The diets nutritional content is questionable and contains multiple warnings. It is recommended to seek the advice of medical practitioner before going on such a restrictive diet, and stay on the diet for no longer than 3 months. The diet may influence the condition of the cervical mucus and within the reproductive tract and follicular fluid. Enabling only one of the two types of sperm to penetrate the egg depending on which diet is adhered to. The aim of this study was to elevate relationship between minerals and sex ratio in rabbits.
