Phytochemical, antibacterial and antioxidant evaluation of *Ceriops decandra* (Griff.) Ding Hou leaf extracts

Nagababu P. and Umamaheswara Rao V.*

*Department of Botany and Microbiology, Acharya Nagarjuna University, Nagarjuna Nagar, Guntur District, Andhra Pradesh, India*

ABSTRACT

The present work focuses on phytochemical screening, antibacterial activity and antioxidant activity of various solvent extracts of *Ceriops decandra* leaf material. The preliminary phytochemical screening was done by using standard protocols and the Antibacterial activity was carried out by using agar well diffusion method. The phytochemical screening study revealed the presence of the important chemicals namely Tannins, Steroids, Terpenoids, Flavonoids and Alkaloids in different solvent extracts of *C. decandra* leaves. Ethyl acetate and Chloroform extracts showed antibacterial activity against most of the Gram positive and Gram negative bacteria tested. However, acetone extract exhibited relatively larger zones of inhibition against the susceptible bacteria than any other solvent extract. The MIC and MBC studies of acetone extract against different bacteria revealed the antibacterial potential of the *C. decandra* leaf material. Acetone extract at 100 µg/ml and 200 µg/ml concentrations showed more free radical scavenging activity than the standard ascorbic acid. The results of this study suggesting the medicinal importance of this plant.

Key words: *Ceriops decandra*, Phytochemicals, Antibacterial activity, antioxidant activity, MIC, MBC.

INTRODUCTION

Medicinal plants are the richest bio-resources of folk medicines and traditional systems of medicine; and food supplements, nutraceuticals, pharmaceuticals and chemical entities for synthetic drugs[1-2]. The use of plants or their extracts for the treatment of human disease predates the earliest stages of recorded civilization, dating back at least to Neanderthal period [3-4]. Pathogenic bacteria have developed resistance against existing antibiotics due to indiscriminate use of antimicrobial drugs to treat the infectious diseases and also more toxic for human being during long term therapy. The problem of microbial resistance is growing and the outlook for the use of antimicrobial drugs in the future is still uncertain. Mangroves are the intertidal salt tolerant group of plants which have wide applications in folk medicine since ages. They are found mainly in the tropical and subtropical intertidal zones of the world largely confined to the region between 30° north and south of the equator. Their ability to survive under very stressful condition has led them to unique morphology and unusual physiological processes[5-6]. Mangrove plants are the best choice to isolate potent bioactive compounds against many pathogenic bacteria. In recent years, there has been a great interest in finding natural antioxidants from plant materials to replace synthetic antioxidants, which are being restricted due to their carcinogenicity. *Ceriops decandra* is an evergreen tree in the inner mangrove forests in Andhra Pradesh, India. It is a straight columnar tree, usually small to medium sized and it belongs to the family Rhizophoraceae and its vernacular name is “calhasu”. It is used in traditional medicine to cure hepatitis and ulcers.
The present study was undertaken to investigate the phytochemical constituents and evaluate the antibacterial and antioxidant potential of various solvent extracts of the *C. decandra* leaves.

**EXPERIMENTAL SECTION**

**Preparation of the plant extracts**

_Ceriops decandra_ (Griff.) Ding Hou plant was collected from Koringa Mangrove forest, near Kakinada, Andhra Pradesh, India (Fig. 1). Leaves of this plant were thoroughly washed and dried in shade. The dried plant material was made into a coarse powder by means of electrical grinder. The dried powdered plant material was extracted in different solvents viz., Hexane, Benzene Chloroform, Ethyl acetate, Acetone and Methanol. The resulted extracts were filtered and then concentrated on a roto evaporator for solvents elimination and the crude extracts were preserved in sterile, air tight containers for further analysis.

![Figure-1. Geographical location map of plant collection](image)

**Preliminary phytochemical screening**

Phytochemical screening was carried out by the following tests [7].

**Test for flavonoids**

**a) Ferric chloride test**

Two ml of the test solution was boiled with distilled water and filtered. Then, few drops of 10% ferric chloride solution were added to the 2 ml of filtrate. A greenish-blue or violet coloration indicates the presence of a phenolic hydroxyl group.

**b) Shinoda's test**

Five grams of each extract was dissolved in ethanol, warmed and then filtered. Small pieces of magnesium chips were then added to the filtrate followed by few drops of conc. HCl. The pink, orange, or red to purple coloration indicates the presence of flavonoids.

**c) Sodium hydroxide test**

Extract of 0.2 gm was dissolved in water and filtered. To this, 2 ml of the 10% aqueous sodium hydroxide was added to produce yellow coloration. A change in color from yellow to colorless on addition of dilute hydrochloric acid was the indication for the presence of flavonoids.

**d) Leadacetate test**

Extract of 0.5 gm was dissolved in water and filtered. To the 5 ml of each filtrate, 3 ml of lead acetate solution
was added. Appearance of a buff-colored precipitate indicates the presence of flavonoids.

**Test for alkaloids**

Five gms of crude powder was stirred with 1% aqueous HCl on water bath and then filtered. To the 1 ml filtrate, few drops of dragendorff’s reagent was added. Orange-Red precipitate was taken as positive. To another 1 ml filtrate, few drops of Mayer’s reagent was added and appearance of buff-colored precipitate will be taken as presence of alkaloids.

**Test for soluble starch**

Crude extract of 0.2 gm was boiled in 1 ml of 5% KOH, cooled and acidified with H$_2$SO$_4$. Yellow coloration indicates the presence of soluble starch.

**Test for Saponins**

Crude powder of 0.5 g was shaken with water in a test tube and it warmed in a water bath. The persistent froth indicates the presence of saponins.

**Test for terpenoids**

Five grams of crude extract was dissolved in ethanol. To this, 1 ml of acetic acid was added followed by conc. H$_2$SO$_4$. A change in color from pink to violet confirms the presence of terpenoids.

**Test for steroids**

a) Salkowskii test

In 2 ml of chloroform, 0.2 g of extract was dissolved and added the conc. H$_2$SO$_4$. The development of reddish brown color at inter phase indicates the presence of steroids.

b) Keller-Killiani test

To 0.5 ml of test solution, 2 ml of 3.5% FeCl$_3$, small amount of glacial acetic acid and 2 ml of conc. H$_2$SO$_4$ were added carefully. Appearance of reddish brown ring at inter phase is a positive indication for the presence of steroids.

c) Liebermann-Burchard test

To 0.2 g of each extract, 2 ml of acetic acid was added and the solution was cooled well in ice followed by the addition of conc. H$_2$SO$_4$ carefully. Color development from violet to blue or bluish-green indicates the presence of a steroidal ring (i.e. aglycone portion of cardiac glycoside).

**Test for carbohydrates**

a) Molisch's test

Two ml of Molisch's reagent was added to the extract dissolved in distilled water and 1 ml of conc. H$_2$SO$_4$ was dispensed along the walls of the test tube. The mixture was allowed to stand for two minutes and then diluted with 5 ml of distilled water. Formation of a dull violet color at the inter phase of the two layers indicates the positive test for carbohydrates.

b) Fehling's test (for free reducing sugars)

The crude extracts were treated with 5.0 ml of Fehling’s solution (A & B) and kept in boiling water bath. The formation of yellow or red color precipitate indicates the presence of free reducing sugars.

c) Fehling's test (for Combined Reducing Sugars)

Extract of 0.5 g was hydrolyzed by boiling with 5 ml of dilute hydrochloric acid and the resulting solution neutralized with sodium hydroxide solution. To this, few drops of Fehling’s solution were added and then heated on a water bath for 2 minutes. Appearance of a reddish-brown precipitate of cuprous oxide indicates the presence of combined reducing sugars.

d) Barfoed's test (for monosaccharide)

In distilled water, 0.5 g of the extract was dissolved and filtered. To 1 ml of the filtrate, 1 ml of Barfoed’s reagent was added and then heated on a water bath for 2 minutes. Reddish precipitate of cuprous oxide formation is the positive test for the presence of monosaccharide.
Test for tannins:
Crude extract of 0.5 g was stirred with 10 ml of distilled water and then filtered. Few drops of 1% ferric chloride solution were added to 2 ml of the filtrate. Occurrence of a blue-black, green or blue-green precipitate indicates the presence of tannins.

a) Borntrager’s Test:
Extract of 0.2 g was shaken with 10 ml of benzene and then filtered. To the filtrate, 5 ml of 10% ammonia solution was added and then shaken the tube well. Appearance of pink, red or violet color in the ammonical (lower) phase indicates the presence of free anthraquinones.

b) Phlonatanins test:
To 0.2g of extract, 1% HCl solution was added. Formation of red precipitate indicates the presence of tannins.

Antibacterial activity of the plant extracts
Microorganisms used
The antibacterial activity of the crude extracts was determined by using both Gram positive and Gram negative bacteria. Nine Gram positive bacteria including Micrococcus luteus MTCC 106, Arthrobacte r rprotophormiae MTCC 2682, Rhodococcus rhodochrous MTCC 265, Bacillus subtilis MTCC 441, Staphylococcus aureus MTCC 737, Bacillus megaterium MTCC 428, Enterococcus faecalis MTCC 439, Streptococcus mutans MTCC 497 and Lactobacillus acidophilus MTCC 1037. Six Gram negative bacteria including Alcaligenes faecalis MTCC 126, Salmonella enterica MTCC 3858, Proteus vulgaris MTCC 426, Proteus mirabilis MTCC 425, Pseudomonas aeruginosa MTCC 1688 and Enterobacter aerogenes MTCC 10208.

Antibacterial screening by agar well diffusion method
Antibacterial screening was determined by agar well diffusion method [8]. Bacterial suspensions of different bacteria were prepared by using 24 hours old bacterial cultures and were cultivated (100 µl) on agar medium. After solidification 6mm diameter wells were punched in agar plate with a sterile cork borer. Streptomycin standard antibiotic was used as positive control in the concentration of 10µg/ml DMSO. A minute quantity of sterile agar suspension was added to the well. 100 µl of the sample which was prepared by dissolving 100mg of sample in 1 ml of DMSO was added to each well. In a separate well, DMSO was also dispensed to maintain the control. The plates were incubated at 37°C for 24 hrs. After incubation, the diameter of the zone of the inhibition was measured. For each sample and bacterial species, triplicates were maintained.

Determination of MIC and MBC
Minimal inhibitory concentration (MIC) was determined by using broth dilution method. Minimal Inhibitory Concentration and Minimal Bactericidal Concentration (MBC) were determined at different concentrations viz., 12.5mg, 25 mg, 50mg, 75mg and 100mg on those bacterial strains which showed zones of inhibition against the plant extracts.

In vitro antioxidant assay
2, 2-diphenyl-1-picryl hydrazyl (DPPH) Free radical scavenging activity
The DPPH free radical scavenging activity of the different extracts was measured according to the method[9]. The crude extracts in different concentrations viz., 100 µg/ml, 200 µg/ml, 300 µg/ml, 400 µg/ml and 500 µg/ml were prepared in DMSO. One ml of each concentrations was mixed with 4 ml of the 0.004% (w/v) solution of DPPH prepared in methanol. The reaction mixture was kept for incubation in dark for 30 minutes. Methanol was used as control and Ascorbic acid was used as positive control. The absorbance was measured at 517 nm. The DPPH scavenging activity (%) was calculated by using the following formula

DPPH scavenging activity (%) = [\((A_0 - A_s) / A_0\) × 100],

Where, \(A_0\) -- absorbance of the control, \(A_s\) -- absorbance of the plant sample
RESULTS AND DISCUSSION

Phytochemical screening
The phytochemical screening study of the C. decandra leaves showed the presence or absence of various phytochemicals in different solvent extracts (Table-1). Flavonoids were present in all the solvent extracts except the chloroform. Hexane, benzene, acetone and methanol extracts were found positive for tannins. Steroids, terpenoids and cardiac glycosides were present in hexane, benzene and chloroform extracts only. Alkaloids were found in benzene and acetone extracts. The free anthraquinones were present in benzene, acetone and methanol extracts. But saponins were not found in any solvent extract. The healing properties of medicinal plants are possibly due to the presence of various phytochemical constituents such as phenolics, flavonoids, alkaloids, terpenoids and phytosterols etc. Phytochemical analysis of plant extracts revealed the presence of constituents which are known to show medicinal properties in addition to physiological activities [10-11]. Several classes of phenols and polyphenols such as phenolics, flavonoids and tannins contribute to plant defense mechanism in resisting pathogenic microorganisms [12].

Antibacterial activity
The antibacterial activity results of different solvent extracts of C. decandra leaves are given in figures 2 and 3. Among the solvent extracts tested for the antibacterial activity ethyl acetate, chloroform and acetone extracts unveiled better results against majority of bacteria used in the study. Ethyl acetate extract showed activity against all the test organisms, except P. aeruginosa. Whereas, chloroform solvent extract exhibited antibacterial activity against all the test organisms except S. enterica and P. aeruginosa. Though acetone extract had shown antibacterial activity only on five Gram positive and two Gram negative bacteria, when compared to ethyl acetate and chloroform, the zone of inhibition caused by acetone extract was larger than other extracts. And M. luteus was found to me more susceptible to acetone extract than other bacteria. Benzene extract was active against M. luteus, R. rhodochrous, B. subtilis, L. acidophilus, A. faecalis and P. vulgaris. Methanol extract showed antibacterial activity against M. luteus, A. protophormiae, B. subtilis, E. faecalis, S. mutans, A. faecalis and P. vulgaris. In our study, R. rhodochrous and E. aerogenes were found resistant to the positive control, streptomycin. But, benzene, chloroform, ethyl acetate and acetone extracts were effective against R. rhodochrous, and chloroform and ethyl acetate extracts exhibited activity on E. aerogenes. Of all the extracts, hexane extract was found to be not so potential as showed the activity only on S. mutans. The present study results showed that ethyl acetate, chloroform and acetone extracts of C. decandra leaves have antibacterial activity. This antibacterial activity of the plant is in agreement with an earlier study that reported the antibacterial activity of C. decandra leaf, root, bark and wood extracts but on only four bacteria [13]. The leaf extract of C. decandra also known to has an ability to prevent the DMBA (Dimethylbenz[a]anthracene) induced carcinoma [14]. In the present study, many phytoconstituents were found in the extracts of C. decandra leaves, which could possibly the reason for the better antibacterial activity against various pathogens. Therefore, the beneficial medicinal effects of plant material may results from the combination of secondary products present in the plant. Secondary metabolites play a role in the plant’s defense through cytotoxicity towards microbial pathogens and this could prove the usefulness of these as antimicrobial medicines for humans.

MIC and MBC
The MIC and MBC studies were done for the acetone extract which has shown significant and larger zones of inhibition against susceptible bacteria and values are tabulated (Table-2). The MIC values for *M. luteus* and *R. rhodochrous* were 25 mg and MBC values were 50 mg. MIC values for *A. protophormiae*, *B. subtilis*, *S. mutans* and *P. vulgaris* were 50 mg and MBC values were 75 mg. For *A. faecalis*, the MIC and MBC values were 75 mg and 100 mg, respectively.

DPPH Free radical scavenging assay
The DPPH Free radical scavenging assay results revealed that the *C. decandra* leaf extracts were found to have good antioxidant activity (Figures 4-8). DPPH radical scavenging activity of *C. decandra* was increased with an increase in concentration of the plant extracts. All the extracts at different concentrations exhibited considerably good antioxidant activity. Acetone extract, in particular, showed more radical scavenging activity at 100µg/ml, 200µg/ml concentrations than the standard ascorbic acid. DPPH is a free radical and accepts electron or hydrogen radical to become a stable diamagnetic molecule [15]. A freshly prepared DPPH solution exhibits a deep purple colour with an absorption maximum at 517 nm. This purple colour generally fades when an antioxidant is present in the medium. Thus, antioxidant molecules can quench DPPH (by providing hydrogen atom or by electron donation) and convert it to a colourless product resulting in decrease in absorbance at 517 nm [16]. Phenolic compounds from plants were responsible for the radical scavenging activity [17]. Phenolic compounds that contain phenyl ring are the diverse group of molecules containing flavonoids, tannins, flavanols and anthocyanines etc. and these phenolic compounds are present in most of the mangrove plants. In the present study, the phytochemical screening revealed the maximum positive results for phenolic compounds and that may be the reason for the free radical scavenging activity of all the extracts tested for antioxidant assay.

CONCLUSION

The present study indicate that the ethyl acetate, chloroform and acetone extracts of *C. decandra* leaves possesses a potential and promising antibacterial and antioxidant activities. Further studies on characterization of bioactive principle and their cytotoxic activities on cell lines are required for various useful applications of this plant against infectious diseases in humans.
