#### Abstract

A series of substituted thieno[2,3-d]pyrimidines was synthesized starting from ethyl 2- amino-4,5-dimethylthiophene-3-carboxylate and ethyl 2-amino-4,5,6,7-tetrahydrobenzo[b]thiophene- 3-carboxylate. Reaction of 2-hydrazino-5,6-dimethylthieno[2,3-d]pyrimidin-4(3H)-one, 2-hydrazino- 5,6,7,8-tetrahydro-3H-benzo[4,5]thieno[2,3-d]pyrimidin-4-one and its 3-allyl analogue with different reagents afforded thieno [2,3-d]triazolo[4,3-a]pyrimidines and thieno[3,2-e]triazolo[4,3- a]pyrimidines, beside open chain derivatives.

Keywords: Thieno[2,3-d]triazolo[4,3-a]pyrimidines; Thieno[3,2-e]triazolo[4,3-a]pyrimidines; Thieno[3,2-e]tetrazolo[1,5-a]pyrimidines; Thiosemicarbazides; Hydrazones

## INTRODUCTION

Thienopyrimidine derivatives have received considerable attention due to their wide range of biological activities such as antimicrobial [1,2], antiviral [3], anticancer [4,5], anti-inflammatory [6,7], antihistaminic [8], antipyretics [9], antianaphylactic [10], anticonvulsant [11] and immunostimulant [12] properties. Besides, many thienopyrimidine compounds exhibited analgesic [13], neurotropic [14], molluscicidal and larvicidal [15] activities. In fact, some of them have been reported to display good activity as Phosphodiesterase [16,17], dihydrofolate reductase (DHFR) [18], VEGF kinase [19] inhibitors, in addition to prevention of cartilage destruction in articular disease [20,21]. In continuation of our previous work on searching antiviral compounds [22-26] and on the title compounds [27], we reported herein the synthesis a new series of thienopyrimidine derivatives.

## EXPERIMENTAL SECTION

Melting points are uncorrected. IR spectra were recorded with PERKIN - ELMER MODEL 1720 FTIR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{CNMR}$ spectra were determined with a varian EM 390 and Bruker AC - 250 spectrometers. The chemical shifts in ppm are expressed in the $\delta$ scale using tetramethylsilane as internal standard. Coupling constants are given in Hz. Mass spectra were recorded on an AEIMS 30 spectrometer. TLC was performed on Merck silica gel 60-F 254 precoated plastic plates. Microanalyses were performed in the unit of microanalysis at the universities of Qassim and Abdul-Aziz (KSA); the results were in satisfactory agreement with the calculated values.

## RESULTS AND DISCUSSION

The starting enamino ester, Ethyl- 2-amino-4,5-dimethylthiophene-3-carboxylate $1_{a}$ and Ethyl- 2-amino-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxylate $1_{\mathrm{b}}$ are prepared according to Karel Gewald procedure [28]. Their reactions with thiourea or potassium thiocyanate in dioxane gave the corresponding thienopyrimidines $3_{\mathrm{a}, \mathrm{b}}$. Subsequent methylation with dimethylsulphate and aqueous NaOH afforded corresponding 2-methylthio derivatives $5_{\mathrm{a}, \mathrm{b}}$ which upon nucleophilic displacement of the SMe group with hydrazine hydrate furnished the respective hydrazino derivatives $7_{\mathrm{a}, \mathrm{b}}$. On the other hand, addition of allylisothiocyanate to 2 - aminothiophene derivatives $1_{\mathrm{a}, \mathrm{b}}$ gave the corresponding thiourea derivatives $2_{a, b}$ which are followed by alkaline cyclization with 2 N sodium hydroxide to thienopyrimidine $4_{b}$. Subjection of $4_{b}$ to hydrazine hydrate resulted in the formation of the 3-allyl-2hydrazinothienopyrimidin derivative $6_{\mathrm{b}}$ (Scheme 1). It is necessary to emphasize that the compounds, 1, 3, 5 and 7 were previously synthesized according to literatures [29] and were used for other purposes.
The structure proposal of the prepared compounds was derived from the analytical data ( ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, IR) and satisfactory elemental analyses. For example the most characteristic bands of IR spectrum in KBr appeared in the range $\bar{v}=1651-1680 \mathrm{~cm}^{-1}$ for $\mathrm{C}=\mathrm{O}$ groups and $\bar{v}=3201-3303 \mathrm{~cm}^{-1}$ corresponding to NH groups. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of Ethyl 2-(3-allylthioureido)-4,5-disubstituted thiophene-3-carboxylate ( $2_{\mathrm{a}, \mathrm{b}}$ ) are in accordance with their structures, The ethyl group for $\left(-\mathrm{COOCH}_{2} \mathrm{CH}_{3}\right)$ showed two bands, the first appeared as triplet at $\delta=1.32 \mathrm{ppm}$ with coupling constant $J=7.3 \mathrm{~Hz}$ and integration equal to 3 protons for $\left(-\mathrm{CH}_{3}\right)$, the second displayed as quartet at higher chemical shift $\delta=4.30 \mathrm{ppm}$ with coupling constant $J=7.2 \mathrm{~Hz}$ and integration equal to 2 protons for ( $-\mathrm{CO}-\mathrm{CH}_{2^{-}}$) group, as they deshielded with oxygen atoms, the other two remaining methyl groups of compound $2_{\text {a }}$ displayed as two singlet peaks at $\delta=2.18,2.19 \mathrm{ppm}$. Compound $2_{\mathrm{b}}$ showed three broad bands at $\delta=1.71,2.56,2.72 \mathrm{ppm}$ for 4 H , 2 H , and 2 H respectively, while its allyl group in $\mathrm{N}-3$ position displayed as follow: $\delta=4.25\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 4.29(\mathrm{q}$, $\left.2 \mathrm{H}, j=7.1 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 5.20\left(\mathrm{dd}, 1 \mathrm{H}, J_{\mathrm{cis}}=10.5 \mathrm{~Hz}, 3^{\prime}-\mathrm{H}_{\mathrm{a}}\right), 5.24\left(\mathrm{dd}, 1 \mathrm{H}, J_{\text {trans }}=17.1 \mathrm{~Hz}, 3^{\prime}-\mathrm{H}_{\mathrm{b}}\right), 5.88\left(\mathrm{~m}, 1 \mathrm{H}, 2^{\prime}-\mathrm{H}\right)$, in addition of two singlet peaks at $\delta=9.57,11.52 \mathrm{ppm}$ for 2 NH groups. The mass spectra exhibited ion molecular peak $\left[\mathrm{M}^{+}\right]$at $\mathrm{m} / \mathrm{z}=324$ corresponding to molecular formula $\left[\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}\right]$ of compound $2_{\mathrm{b}}$.
The ${ }^{1} \mathrm{H}$-NMR spectrum of 3-Allyl-2-mercapto-5,6,7,8-tetrahydro-3H-benzo[4,5]thieno[2,3- d]pyrimidin-4-one $4_{\mathrm{b}}$ showed three multiplet bands at $\delta=1.80,2.77,2.86 \mathrm{ppm}$ for $4 \mathrm{H}, 2 \mathrm{H}$, and 2 H respectively while its allyl group in N 3 position appeared at $\delta=4.57\left(\mathrm{bd}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 5.31\left(\mathrm{bm}, 2 \mathrm{H}, 3^{\prime}-\mathrm{H}_{\mathrm{a}}, 3^{\prime}-\mathrm{H}_{\mathrm{b}}\right), 5.91\left(\mathrm{bm}, 1 \mathrm{H}, 2^{\prime}-\mathrm{H}_{\mathrm{b}}\right)$, beside one band at $\delta=14.08 \mathrm{ppm}$ for NH group and its molecular ion $\operatorname{peak}\left[\mathrm{M}^{+}\right]$at $\mathrm{m} / \mathrm{z}=278$ corresponding to formula $\left[\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}\right]$.

The resulted data of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of starting materials 3-Allyl-2-hydrazino-5,6,7,8-tetrahydro- 3H-benzo[4,5]thieno[2,3-d]pyrimidin-4-one $\left(6_{\mathrm{b}}\right)$ showed three multiplet bands at $\delta=1.74,2.61,2.80 \mathrm{ppm}$ for $4 \mathrm{H}, 2 \mathrm{H}$, and 2 H respectively in addition of allyl group bands at $\delta=4.58\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 4.98\left(\mathrm{dd}, 1 \mathrm{H}, J_{\mathrm{cis}}=10.3 \mathrm{~Hz}, 3^{\prime}-\mathrm{H}_{\mathrm{a}}\right)$, $5.11\left(\mathrm{dd}, 1 \mathrm{H}, J_{\text {trans }}=17.2 \mathrm{~Hz}, 3^{\prime}-\mathrm{H}_{\mathrm{b}}\right), 5.83\left(\mathrm{~m}, 1 \mathrm{H}, 2^{\prime}-\mathrm{H}\right)$ beside bands of hydrazino group at $\delta=4.35,8.23 \mathrm{ppm}$ corresponding to $(2 H)$ and $(1 \mathrm{H})$. Starting materials 2-hydrazinyl-5,6-disubstitutedthieno[2,3-d]pyrimidin-4(3H)-one $\left(7_{a, b}\right)$ condensed with various one-carbon donors, for instance, they reacted with isocyanates and isothiocyanates to provide the corresponding semi and thiosemicarbazides $8_{\mathrm{a}, \mathrm{b}}$ and $10_{\mathrm{a}, \mathrm{b}}$ respectively. Condensation of $7_{\mathrm{a}, \mathrm{b}}$ with acetophenone derivatives in the presence of few drops of acetic acid furnished the corresponding hydrazones $9_{\mathrm{a}-\mathrm{c}}$. Starting compound $7_{\mathrm{b}}$ condensed with 2,4-pentadione resulted in the formation of the corresponding pyrazole derivative 11 in good yield (Scheme 2). The constitution of the prepared compounds was secured by their NMR, IR, and MS spectra, for instance, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $8_{\mathrm{a}}$ showed three bands at $\delta=1.75,2.65,2.70 \mathrm{ppm}$ for $4 \mathrm{H}, 2 \mathrm{H}$, and 2 H respectively besides five protons of phenyl group appeared in three bands $\delta=6.96,9.22,11.80,12.02 \mathrm{ppm}$ corresponding to four NH group. Acetophenone hydrazone compounds $9_{\mathrm{a}-\mathrm{c}}$ showed absorbance in IR spectra at $v=$ $1662-1668 \mathrm{~cm}^{-1}$ for stretching $\mathrm{C}=\mathrm{O}$ group and absorbance peak at $v=3228-33.77 \mathrm{~cm}^{-1}$ for NH group. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 9 a displayed three bands at $\delta=1.77,2.52,2.82 \mathrm{ppm}$ for $4 \mathrm{H}, 2 \mathrm{H}$, and 2 H respectively besides one singlet band at $\delta=2.32 \mathrm{ppm}$ for methyl group, in addition to five protons of phenyl group appeared in the range $\delta=7.43$ 8.0 ppm while the protons of NH group resonate at $\delta=10.62,10.91 \mathrm{ppm}$, the structure is finally mass spectra showed molecular ion peak $\left[\mathrm{M}^{+}\right]$at $\mathrm{m} / \mathrm{z}=338$ closed with formula $\left[\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{~N}_{4} \mathrm{OS}\right]$.

## Synthesis of Triazolo-thienopyrimidine Derivatives

Starting material 3-Allyl-2-hydrazino-5,6,7,8-tetrahydro-3H-benzo[4,5]thieno[2,3-d]pyrimidin-4-one ( $6_{\mathrm{b}}$ ) condensed with various one-carbon donors such as acetic acid, formic acid, triethylorthoformate, isothiocyanates, isocyanates, carbondisulphide and aldehydes to give poly condensed triazolo-thienopyrimidine derivatives. For instance, treatment of the hydrazino compound $6_{b}$ with formic acid or triethylorthoformate gave exclusively the product angular triazolo-thienopyrimidine (272), since $\mathrm{N}-3$ is blocked by allyl group, while it reacted with glacial acetic acid or triethylorthoacetate to provide methyl substituted triazolo- thienopyrimidine derivative (273), while $6_{\mathrm{b}}$ refluxed with alcoholic solution of carbon disulphide in the presence of pyridine resulted in the formation of mercaptotriazolo- thienopyrimidine (274). Addition of isocyanates and isothiocyanates to starting material ( $6_{\mathrm{b}}$ ) provide the corresponding semi and thiosemi-carbazides $276_{\mathrm{a}-\mathrm{d}}$ and $275_{\mathrm{a}-\mathrm{c}}$ respectively. An expected cyclization of semi-carbazide derivatives take place upon treatment of compounds $276_{\mathrm{a}-\mathrm{d}}$ with a solution of $\mathrm{NaOH}(2 \mathrm{~N})$ to provide amino-triazolothienopyrimidines $270_{\mathrm{a}, \mathrm{b}}$, while treatment of thiosemi-carbazode with $\mathrm{NaOH}(2 \mathrm{~N})$ didn't provide an expected cyclization, all derivatives gave mercaptotriazolo-thienopyrimidine (274). Condensation of $266_{b}$ with aromatic aldehydes furnished the corresponding hydrazones ( $277_{\mathrm{a}-\mathrm{f}}$ ). Dehydrogenative cyclization of $277_{\mathrm{a}}$ by ethanolic $\mathrm{FeCl}_{3}$ solution afforded the triazolothienopyrimidines 279 (Scheme 3).
The constitution of the prepared compounds was secured by their NMR, IR, and MS spectra, for instance, compound 272 showed absorbance in IR spectra at $v=1666 \mathrm{~cm}^{-1}$ for stretching $\mathrm{C}=\mathrm{O}$ group while no any appearance of any stretched absorbance peak for NH group.
