Sara Nabil AbdElal<br>Department of Chemistry, Faculty of Science (Girls), Al-AzharUniversity, Naser City, Cairo, Egypt

#### Abstract

Cyclohexenone derivative (2) prepared by reaction of butanoic acid (1) with ethyl acetoacetate reacts with aromatic aldehydes, hydrazine hydrate, thiosemicarbazide to give arylidene, indazole and thiotriazole derivatives. The behavior of the obtained thiotriazole towards hydrazine hydrate, aromatic amines, sodium nitrite, acetylacetone, anthranilic acid, thiourea, benzalacetophenone has been studied. The structure of all synthesized compounds were confirmed by micro analytical and spectral data. The antitumor activity of some of the synthesized compounds were tested.

Keywords: cyclohexenone, indazole and thiotriazole derivatives, antitumor activity.

## INTRODUCTION

In the last several decades, cyclohexenone and indole derivatives have received considerable attention due to their wide range of applications. Cyclohexenone derivatives exhibit antifungal[1]'fluorescent[2]and anticancer[3]activity.

On the other hand, indole derivatives exhibit antioxidant[4],anti-microbial[5,6], antimalarial[7]anti-proliferative [8]anti-tumor [9]and also used as antivascular agents[10]

Encouraged by these reports, the present investigation deals with synthesizing a new series of cyclohexenone containing the 2 -phenyl indolemoiety hoping to improve the antitumor activity of the new compounds.

[^0]Sulforhodamine-B(SRB)assay of cytotoxic activity:
MCF7 (breast carcinoma cell line), HEPG2 (hepatocellular carcinoma cell line), HCT116(colon carcinoma cell line) were obtained frozen in liquid nitrogen $\left(-180^{\circ} \mathrm{C}\right)$ from the American type culture collection. The tumor cell lines were maintained in the National cancer Institute, Cairo, Egypt, by serial sub-culturing. Potential cytotoxicity of $\mathbf{2 , 3 a}, \mathbf{6}, \mathbf{7}, \mathbf{8 a}, \mathbf{b}, \mathbf{1 0}, \mathbf{1 1}, \mathbf{1 3}, \mathbf{1 4}$ and $\mathbf{1 7}$ were tested using the method of Skehan et al.

Principle:
The sensitivity of the human tumor cell lines to thymoquinone was determined by the SRB assay. SRB is a bright pink aminoxanthrene dye with two sulfonic group. It is a protein stain that binds to the amino groups of intracellular proteins under mildy acidic conditions to provide a sensitive index of cellular protein content.

## Procedure

1-Cells were used when $90 \%$ confluence was reached in T25 flasks. Adherent cell lines were harvested with 0.025 \% trypsin. Viability was determined by trypan blue exclusion using the inverted microscope (Olympus 1x70, Tokyo, Japan) .
2-Cells were seeded in 96- well microtiter plates at a concentration of $5 \times 10^{4}-10^{5}$ cell / well in a fresh medium and left to attach to the plates for 24 hrs .
3-After 24 hrs., cells were incubated with the appropriate concentration ranges of drugs, completed to total of $200 \mu \mathrm{l}$ volume / well using fresh medium and incubation was continued for 24,48 and 72 hrs . Control cells were treated with vehicle alone. For each drug concentration, 4 wells were used .
4 -Following 24,48 and 72 hrs . treatment, the cells were fixed with $50 \mu \mathrm{l}$ cold $50 \%$ trichloroacetic acid for 1

## hr. at $4^{\circ} \mathrm{C}$.

5-Wells were washed 5 times with distilled water and stained for 30 min . at room temperature with $50 \mu \mathrm{l} 0.4 \%$ SRB dissolved in $1 \%$ acetic acid .
6-The wells were then washed 4 times with $1 \%$ acetic acid .
7-The plates were air-dried and the dye was solubilized with $100 \mu \mathrm{l}$ / well or 10 mMtris base ( Ph 10.5 ) for 5 m in on a shaker (orbital shaker 0520, Boeco, Germany) at 1600 rpm .
8- The optical density (O.D.) of each well was measured spectrophotometrically at 564 nm with an ELIZA microplate reader (Meter tech $\sum 960$, U.S.A.). The mean background absorbance was automatically substracted and mean values of each drug concentration was calculated. The relation between survival fraction and compound concentration was plotted to get the survival curve of each tumor cell lines (Fig.1), The IC50 values (the concentrations of thymoquinonerequired to produce $50 \%$ inhibition of cell growth (Fig. 2).

Cytotoxicity against different human cancer cell lines in vitroFor evaluation of anti-tumor cytotoxicity of compounds $\mathbf{2 , 3 a}, \mathbf{6}, \mathbf{7}, \mathbf{8 a}, \mathbf{b}, \mathbf{1 0}, \mathbf{1 1}, \mathbf{1 3}, 14$ and $\mathbf{1 7}$, three different human cancer cell lines were used : MCF7 (breast carcinoma cell line), HEPG2 (hepatocellular carcinoma cell line), HCT116(colon carcinoma cell line). Cytotoxicity and IC50 values of the tested compounds are shown in Fig. I and II. The survival fraction was gradually decreased as the concentration of the tested compounds was increased (Table 1).

From figure II, it has been shown that $\mathbf{6 , 7 , 8 a , b , 9 , 1 0 , 1 1 , 1 7}$ are the compounds of lowest IC50 which means that they are the most effective cytotoxic drugs, accordingly compounds 10 and $\mathbf{1 1}$ can beused as very potent cytotoxic drug for breast carcinoma cell, $\mathbf{6}$ for liver carcinoma cell and 7,8a,b,17 as colon carcinoma cell cytotoxic drug, while $\mathbf{4}$ as moderate cytotoxic drug for liver carcinoma cell respectively, while the remaining compounds are very weak cytotoxic drug .
